

ENFLOW™ FLUID AND BLOOD WARMING

LATEX FREE

The enFlow™ system enables warmed blood or IV fluid delivery at the right time across all clinical areas. By consistently helping to maintain the right patient body temperature, enFlow can help provide both clinical and economic benefits for your hospital. Maintaining normothermia can help lessen complications and speed up recovery time—all while helping to shorten patient stays and reduce hospital costs.

FUNCTIONALITY

- Easy to read, self-orienting display
- Effective warming from KVO to 200mL/min
- Cartridge can remain in-line during transport
- Accompanies patients throughout the care continuum

The warmer is designed to work in conjunction with the disposable cartridge to warm blood or IV fluids. Can be placed within inches of the IV site, reducing the potential for fluid cooling within the IV line.

ENFLOW™ AND ACCESSORIES

ITEM	DESCRIPTION	PK
980121EU	Controller	1
